

# **AI Workflow Automation — When NoCode Delivers and When More Is Required**

AI Workflow Automation for Small Teams That Need Big Results

**NoCode is brilliant... until it isn't.**

## **When 'simple' turns complex**

- Custom scripts and brittle branches creep in fast.
- Adhoc webhooks and messy data flows.
- No visibility into what's running — or why it failed.

## **Why AI + NoCode stalled for us**

- Hard to get targeted functionality without orchestration.

- Inconsistent outputs over time (prompt drift).
- Node sprawl — too many steps, hard to evolve.

## **The Hybrid Approach: No■Code + Coded Backbone**

- No■code where it fits: triggers, OAuth, pre■defined AI nodes.
- Code where it counts: decisions, safety, orchestration, versioning.
- LangChain graphs provide structure, reliability, and traceability.

## **The Supervisory UI and Vibe Coding**

- Vibe coding builds the backbone + UI for visibility and diagnostics.
- Helps maintain flow, readability, and testability.
- But like no■code, it has its own limits — another topic to explore.

## **How We Measure Success**

- ■■ Time■to■Feature (time to benefit)
- ■ First■Pass Success / Quality
- ■■ AI Contribution Stability & Reliability
- Supporting metrics: p95 run duration & resource usage.

## **See the Hybrid Approach in Action**

Curious how this works in real life? Watch a 90■second walkthrough that shows the evidence panel, run timeline, and diagnostics.  
Then, let's chat. We can scope a short brief and spin up a working prototype in days.
